

Government of
Northwest Territories

If you're
THINKING
of ringing in the
NEW YEAR
with a
BANG

You might want to get tested first!

Syphilis is an infection usually spread by sexual contact. The first sign of infection is usually a painless sore on the genitals, anus or inside of mouth. It usually goes away and is really easy to miss! If left untreated, it can cause serious health problems and even death. The only way to know you have syphilis is by getting tested.

GET TESTED TODAY!

Call your local public health clinic or community health centre to book an appointment.
